Facts & Figures about CE marking

On this page you can see different layers of information projected on the map of Europe. The data that has been used is from RAPEX, a rapid alert system for dangerous non-food products and provides information from 2005 to 2016 about products containing a CE-marking. The purpose of this page is to inform you about how all countries in Europe are performing. The topics concern the amount of notifications, the product categories, risks and countries who report versus countries who adopt notifications. When you move your mouse over this map of Europe you can see the exact numbers or extra information.

| Amount of notifications | Most common product categories | Most common risks | Shared notifications |

Amount of notifications

This map compares the number of notifications for product with a CE mark according to country. The darker the color, the more notifications. It shows that market surveillance authorities in Spain, Hungary and the United Kingdom notified a relatively large number of products. However, the question is how these differences could be explained. What do you think?
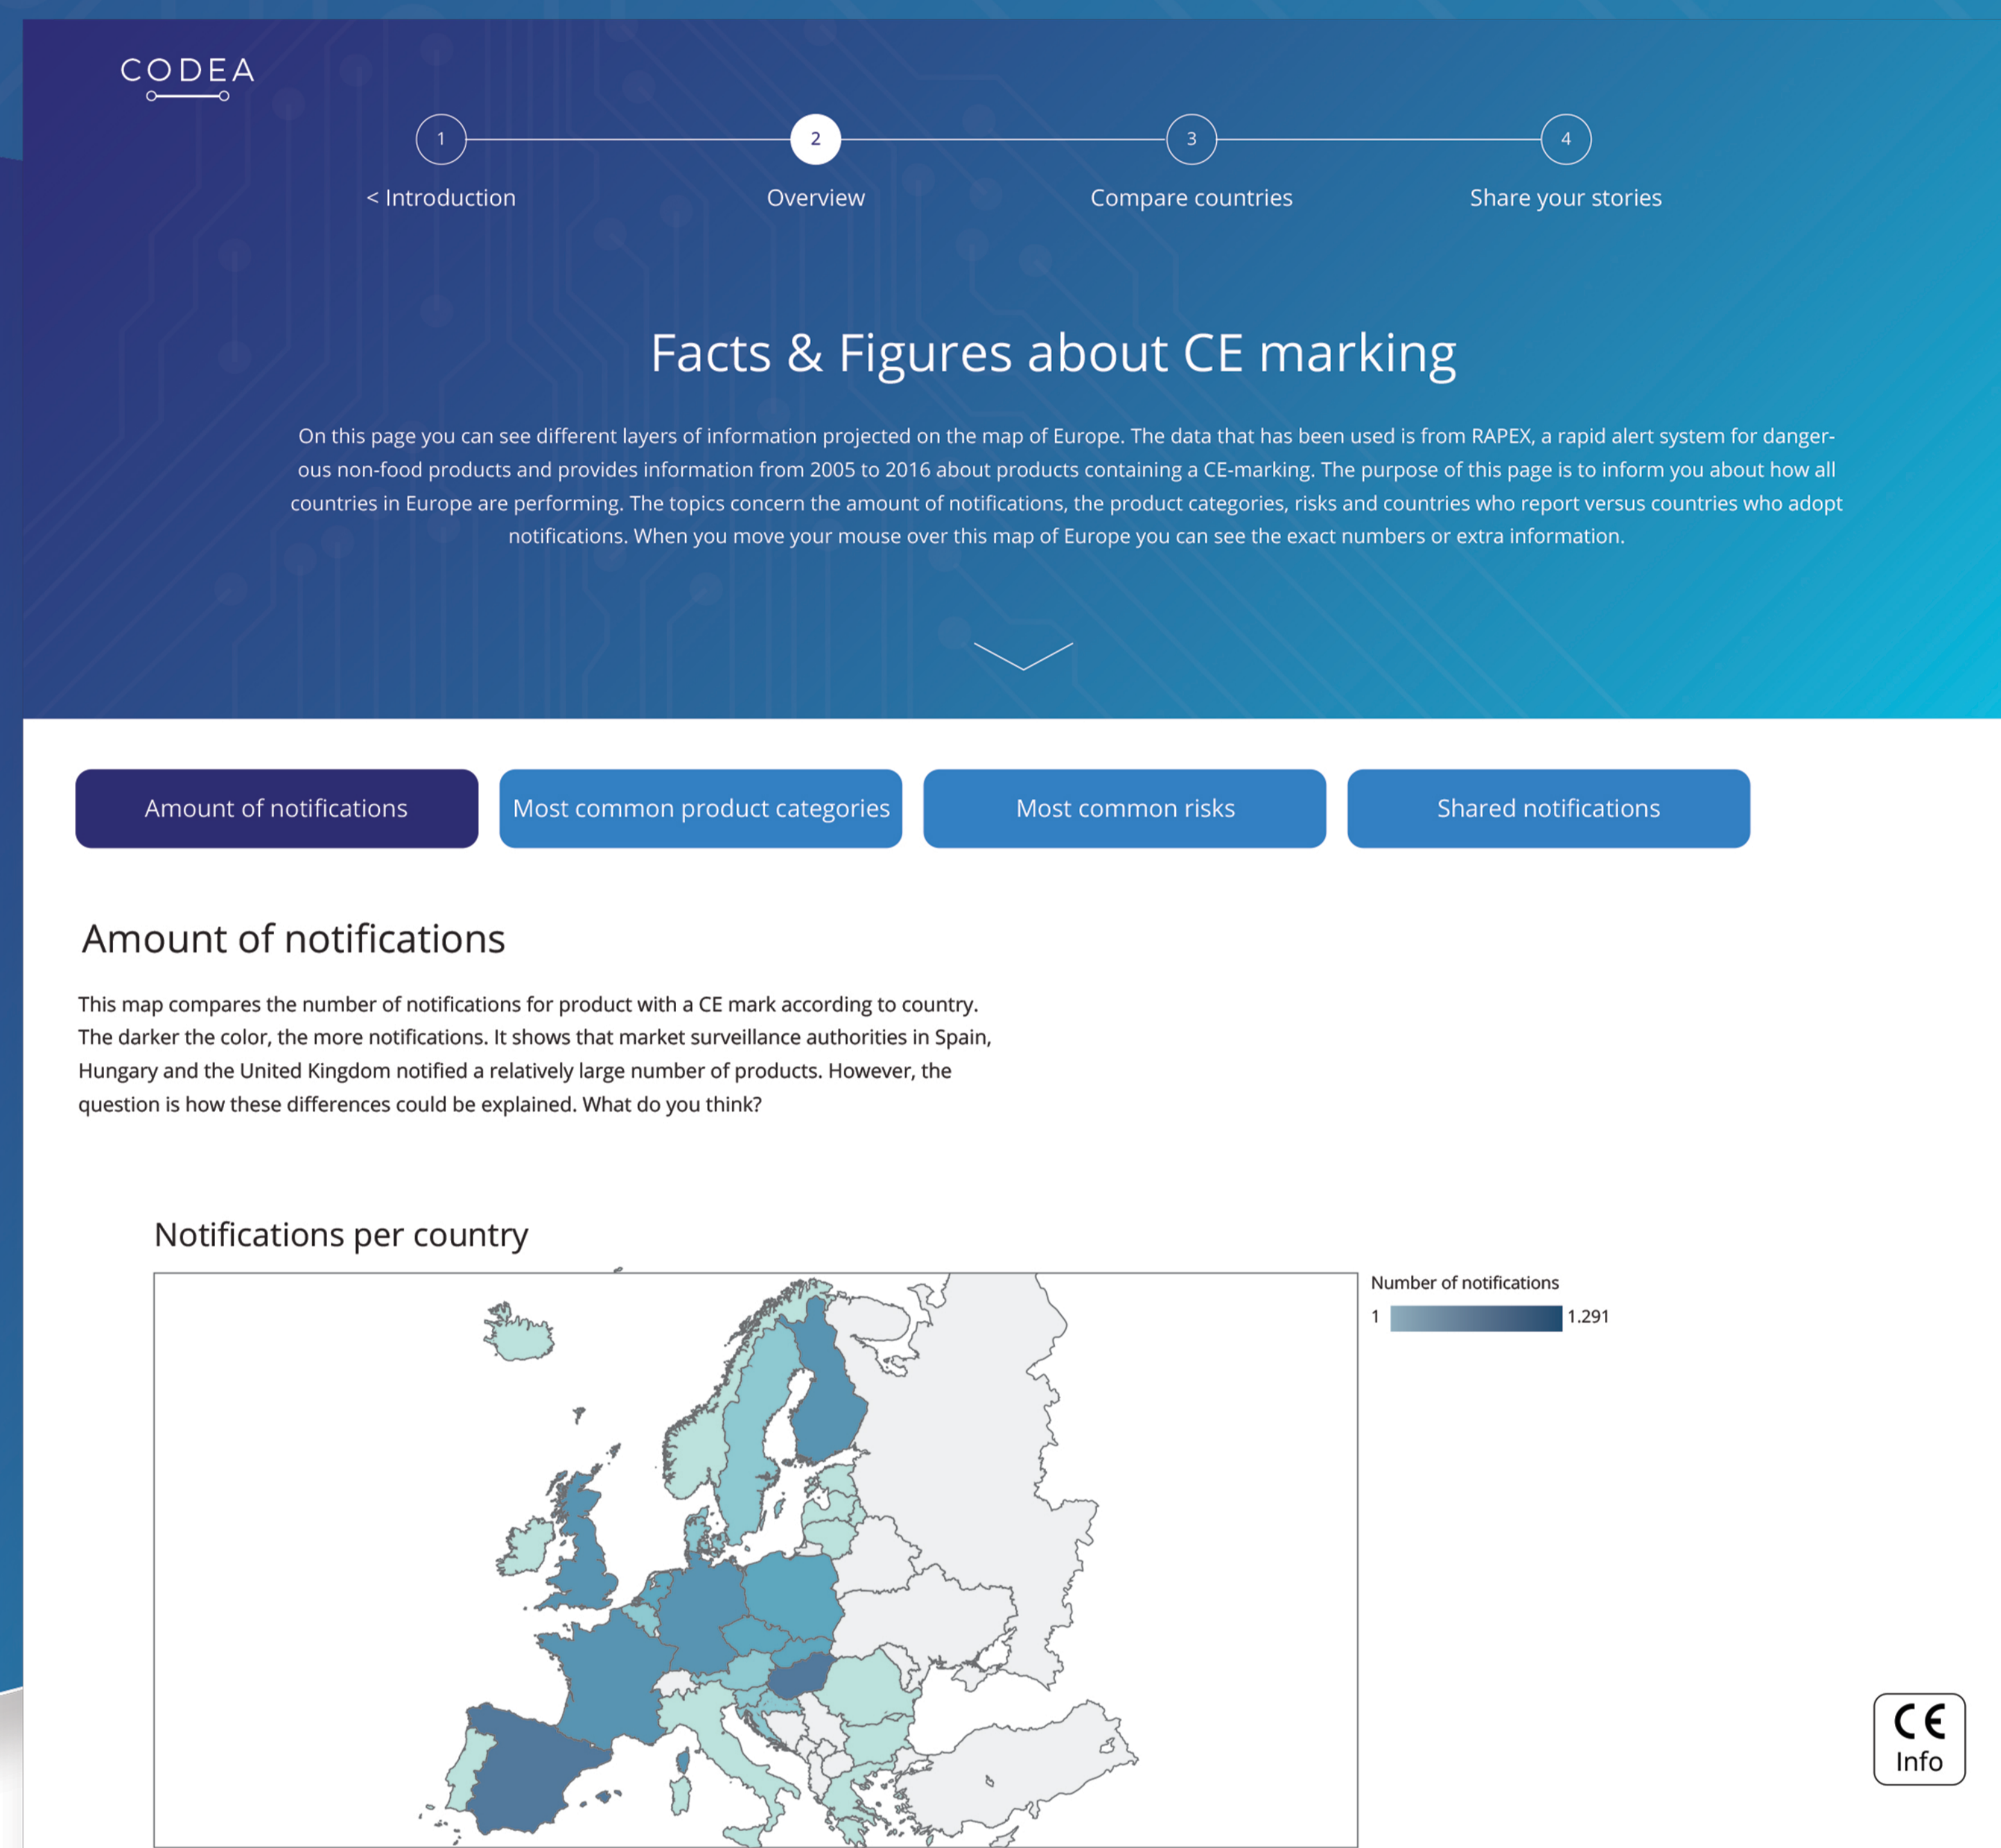

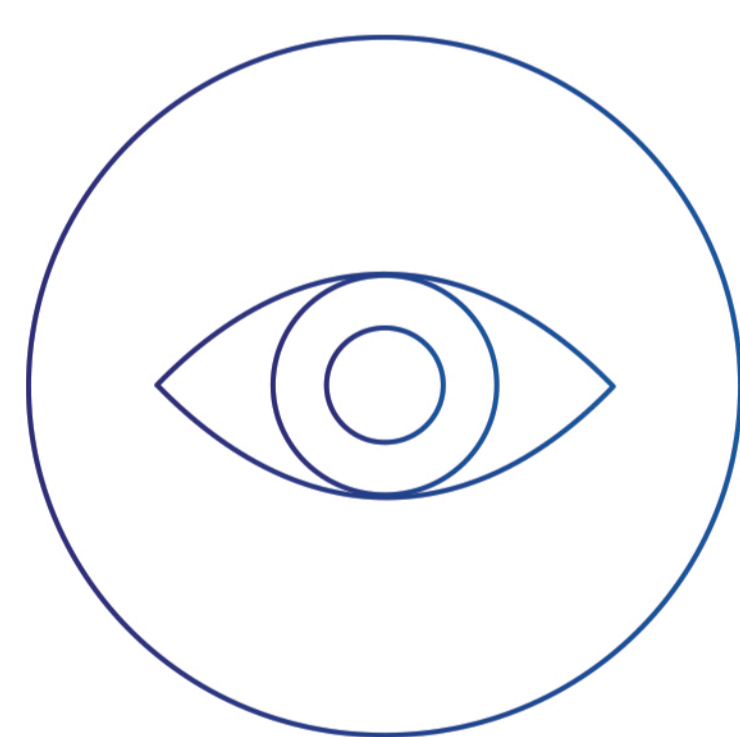

Notifications per country

Number of notifications
1   1.291
